

# Build and Deploy AppBundles

When building AppBundles, the bundle should be created and tested as a distribution before being deployed to Maven as an AppBundle.

On this page:

To create a distribution, see [Use the Maven Distribution Archetype](#). Once your distribution is working, follow the instructions below to build and deploy it.

- [Build the AppBundle](#)
- [Deploy the AppBundle](#)

---

## Build the AppBundle

In order to build your AppBundle and install it in your local Maven repository, use the following command:

```
mvn clean install -P build-appBundle
```

Once installed in your local repository, the AppBundle can be tested locally.

## Deploy the AppBundle

In order to deploy your AppBundle to the public Maven repository, use the following command:

```
mvn clean deploy -P build-appBundle
```

Once installed in your public repository, the AppBundle will be available to Aspire applications.
