REST APIs

Administration API

Administration API provides the mechanisms to create, configure, and delete Storage Units.

Template API

Template API allows the creation and management of configuration templates for Storage Units.

Security API

Security API provides authentication/authorization management when the Staging Repository is running in secure mode.

Transaction

Transaction API provides the functionality to interact with Storage Unit content: add, update, and delete content to record scopes.

Access API

Access API provides fetch operations for records in Storage Units.

Subscription API

Subscription API provides real-time updates from Storage Units to subscribing clients.

Reprocess API

Reprocess API provides the ability to process stored content of a Storage Unit against a list of content processing module.

Replication API

Replication API provides client subscription functionality to external Staging Repository Storage Units – to replicate the remote content locally. Remote content is tagged with a *zone id*.
