

Azure AD Group Expander Developer Notes

Request Message

Job request messages read by the Azure AD Group Expander have the following format:

```
<doc actionProperties="cacheGroups" />
```

Configuration

Element	Type	Default	Description
clientId	string		Client ID assigned to the application registered on Windows Azure.
clientSecret	string		Client Secret Key created for the Windows Azure application.
tenantDomain	string		Domain of your Office 365 instance in the following format: <domain>. onmicrosoft.com .
lowerCase	boolean	false	Flag to lowercase all the entries in the group expansion cache.

Configuration Example

```
<component name="AADCache" subType="default" factoryName="aspire-azure-groupexpander">
  <debug>${debug}</debug>
  <clientId>${clientId}</clientId>
  <clientSecret>${clientSecret}</clientSecret>
  <tenantDomain>${tenantDomain}</tenantDomain>
  <lowerCase>${lowerCase}</lowerCase>
</component>
```

Results

All results from the group expansion are saved into a cache file so they can be picked up by the connectors that need the information.
