StageR Publisher Prerequisites

Version of StageR required

The Aspire StageR publisher was created and tested using version 1.0.

Before installing the StageR publisher, make sure that:

- StageR is up and running

  The Aspire StageR connector was created and tested using Version 1.0.

  For more details on the StageR, see here.

Certificate Requirements

If the StageR is using *https*, the appropriate certificates will need to have been installed in Aspire.

NOTE: If you are running using https, we recommend that a *StageR* user with the *admin* role is used for publishing documents.

If you use a non-administrative user, that user will not have the permissions required to create storage units, and publishing from Aspire is likely to fail.

If you cannot use an administrative user, you will need to ensure that every storage unit published to is pre-created (prior to publishing from Aspire) using the *StageR-UI* or the the StageR Administration API.

Windows or Linux

The StageR publisher runs on either Windows or Linux.
