Getting Started with the Framework

Get to Know Aspire

- Prerequisites to Using the Framework
    - Installing Java for Connectors and Content Processing
    - Installing and Configuring Maven
    - Hardware and Network Considerations

Install Aspire

The best way to use Aspire as a component and pipeline framework (without the connectors and publishers), is to use our Maven Distribution Archetype. This will set up a Maven Project which you can modify to build a variety of different Aspire framework installations (for different environments or variations, for example), or to create "Application Bundles" which can then be used as workflow components with the connector framework.
