

Elasticsearch in Azure

Notes

The Azure Search Service has a similar REST API interface using JSON to Elasticsearch, However it is not as complete. For example, considering the bulk indexing feature that Elasticsearch has, our Elasticsearch publisher uses it like this:

In the app-publish-to-elasticsearch application.xml:

```
<component name="PostHTTP" subType="default" factoryName="aspire-post-http" enable="${ElasticNoUrl}">
...
<postUrl>http://${ElasticHost}:${ElasticPort}/_bulk</postUrl>
...
</component>
```

We should be able to publish to Azure Search Service by using the `{{Aspire_2.0_Post_HTTP}}` with the required configuration changes and groovy builders to transform to the correct JSON syntax.
