Documentum DQL For Developers

Documentum DQL Source

Detailed information on configuring the Documentum DQL source. This also includes a discussion about all of the metadata produced by the source, with an example.

Documentum DQL Fetch URL

Detailed information on the Documentum DQL FetchUrl java component, which opens an InputStream to the given URL and that can be read by down-stream pipeline stages. This is only needed by programmers who intend to integrate the Documentum DQLscanner in novel ways that are not supported by the standard framework and routing table.

Documentum DQL Group Expansion

Detailed information on configuring the Documentum DQL group expansion component. This is bundled with the Documentum DQL connector, so the component information is only needed by programmers with custom Documentum DQL integration needs.
