

# Configuration

This section describes configuring general features within Aspire 5. For Individual Connector configuration details go to [Connectors](#) and select the one you are interested in.

General features like: Authentication, NoSQL provider parameters, Manager/Worker node behavior properties, Resource limits, etc, are configured in two different ways:

- [Settings](#) JSON uploaded into the NoSQL database
- [Environment variables](#)

There is also a way of configuring the Memory Usage of the JVM, follow [Memory settings](#) for more information.

Most of the properties can be configured either in the settings or the environment variables.
